

Neoprene and Silicone Air Ducting Hose

Neoprene Air Duct Widely used for cockpit cooling and other low pressure ducting applications. Contains a bronze coated spring-steel wire support helix. The fiberglass fabric cover and fiberglass cord are both impregnated and coated with neoprene rubber. The temperature limit is 300°F. The maximum continuous length available is 12 feet. The 2.00, 2.50 and 3.00 inch diameter duct is available in 6 or 12 foot lengths only. Shorter pieces can be screwed together to form a continuous length.

Silicone Rubber Air Duct Construction is the same as above except uses high-temperature silicone rubber instead of neoprene. This allows operation up to 550°F which makes this extremely popular for brake cooling ducts. The maximum continuous length is 12 feet; 2.00, 2.50 and 3.00 inch diameter duct is available in 6 or 12 foot lengths only. Shorter pieces can be screwed together to form a continuous length.

Thermo-formed Air Inlet Ducts

Computer Aided Design (CAD) and wind tunnel testing have been combined to produce these ducts. Attention to detail results in maximum air flow with minimal drag. They are molded from tough, high-impact clear or black plastic. An integrally molded flange (approximately .75" wide on most ducts) makes them easy to install in body panels, air dams or side windows. The outlet nipples are sized to fit our air ducting hose (see above).
